Description

The present invention relates to a class of indole-substituted five-membered heteroaromatic compounds which act on 5-hydroxytryptamine (5-HT) receptors, being specific agonists of so-called "5-HT_1-like" receptors. They are therefore useful in the treatment of clinical conditions for which a selective agonist of these receptors is indicated.

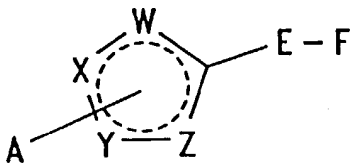
5-HT_1-like receptor agonists which exhibit selective vasoconstrictor activity have recently been described as being of use in the treatment of migraine (see, for example, A. Doenicke et al., The Lancet, 1988, Vol. 1, 1309-11). The compounds of the present invention, being specific 5-HT_1-like receptor agonists, are accordingly of particular use in the treatment of migraine and associated conditions, e.g. cluster headache, chronic paroxysmal hemicrania and headache associated with vascular disorders.

EP-A-0313397 describes a class of tryptamine derivatives substituted by a five-membered heteroaliphatic ring, which are stated to act as specific agonists of a particular type of "5-HT_1-like" receptor and thus to be effective therapeutic agents for the treatment of clinical conditions, particularly migraine, requiring this activity. However, EP-A-0313397 neither discloses nor suggests the heteroaromatic compounds provided by the present invention.

EP-A-0225726 relates to indole derivatives having potent and selective vasoconstrictor activity which are stated to be useful in treating pain originating from dilation of the carotid vascular bed, in particular migraine and cluster headache. There is, however, no disclosure nor any suggestion in EP-A-0225726 of the five-membered heteroaromatic ring-containing compounds provided by the present invention.

EP-A-0328200 describes a class of 5-membered heterocyclic compounds having at least one heteroatom, substituted on the heterocyclic ring by an azacyclic or azabicyclic ring system or an amino substituent. These compounds are stated to be useful in the treatment of psychotic disorders (e.g. schizophrenia and mania); anxiety; alcohol or drug withdrawal; pain; gastric stasis; gastric dysfunction; migraine, nausea and vomiting; and presenile and senile dementia. However, they have no action on the 5-HT_1-like receptors of which the heteroaromatic compounds of the present invention are specific agonists, and therefore elicit their effect by a different mechanism.

The present invention provides a compound of formula I, or a salt thereof:



(I)

wherein the broken circle represents two non-adjacent double bonds in any position in the five-membered ring;

the five-membered ring containing the substituents W to Z represents a 1,2,4-oxadiazole, 1,3,4-oxadiazole, 1,2,4-thiadiazole, 1,3,4-thiadiazole, 1,3-oxazole or 1,3-thiazole ring;

For use in medicine, the salts of the compounds of formula I will be non-toxic pharmaceutically acceptable salts. Other salts may, however, be useful in the preparation of the compounds according to the invention or of their non-toxic pharmaceutically acceptable salts. Suitable pharmaceutically acceptable salts of the compounds of this invention include acid addition salts which may, for example, be formed by mixing a solution of the compound according to the invention with a solution of a pharmaceutically acceptable non-toxic acid such as hydrochloric acid, fumaric acid, maleic acid, succinic acid, acetic acid, citric acid, tartaric acid, carbonic acid or phosphoric acid. Furthermore, where the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof may include alkali metal salts, e.g. sodium or potassium salts; alkaline earth metal salts, e.g. calcium or magnesium salts; and salts formed with suitable organic ligands, e.g. quaternary ammonium salts.

Suitable alkyl groups include straight-chained and branched alkyl groups containing from 1 to 6 carbon atoms. Typical examples include methyl and ethyl groups, and straight-chained or branched propyl and butyl groups. Particular alkyl groups are methyl, ethyl and t-butyl.

Where the compounds according to the invention have at least one asymmetric centre, they may accordingly exist as enantiomers. Where the compounds according to the invention possess two or more asymmetric centres, they may additionally exist as diastereoisomers. It is to be understood that all such isomers and mixtures thereof are encompassed within the scope of the present invention.

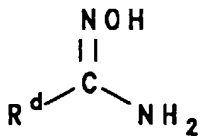
The invention also provides pharmaceutical compositions comprising one or more compounds of this invention in association with a pharmaceutically acceptable carrier. Preferably these compositions are in unit dosage forms such as tablets, pills, capsules, powders, granules, sterile parenteral solutions or suspensions, or suppositories, for oral, parenteral or rectal administration. For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e. g. water, to form a solid preformulation composition containing a homogeneous mixture of a compound of the present invention, or a non-toxic pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily subdivided into equally effective unit dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from 0.1 to about 500 mg of the active ingredient of the present invention. The tablets or pills of the novel composition can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be separated by an enteric layer which serves to resist disintegration in the stomach and permits the inner component to pass intact into the duodenum or to be delayed in

release. A variety of materials can be used for such enteric layers or coatings, such materials including a number of polymeric acids and mixtures of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

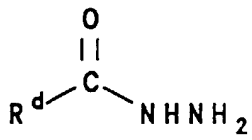
The liquid forms in which the novel compositions of the present invention may be incorporated for administration orally or by injection include aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable dispersing or suspending agents for aqueous suspensions include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinylpyrrolidone or gelatin.

In the treatment of migraine, a suitable dosage level is about 0.01 to 250 mg/kg per day, preferably about 0.05 to 100 mg/kg per day, and especially about 0.05 to 5 mg/kg per day. The compounds may be administered on a regimen of 1 to 4 times per day.

The oxadiazole compounds of this invention may be prepared by a process which comprises reacting a reactive derivative of a carboxylic acid of formula R^c-CO_2H with a compound either of formula III or of formula IV, or a salt thereof:



(III)

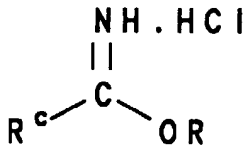


(IV)

wherein one of R^c and R^d is a group of formula A, and the other is a group of formula -E-F, as defined with reference to formula I above.

Suitable reactive derivatives of the acid R^c-CO_2H include esters, for example C_{1-4} alkyl esters; thioesters, for example pyridylthioesters; acid anhydrides, for example $(R^cCO)_2O$; acid halides, for example acid chlorides; orthoesters; and primary, secondary and tertiary amides.

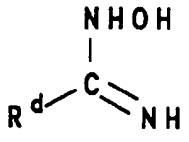
A preferred reactive derivative of the acid R^c-CO_2H is the iminoether derivative of formula V:



(V)

where R is C_{1-4} alkyl.

When the compound of formula III is employed the product of the reaction is a 1,2,4-oxadiazole. It will be appreciated that the compound III can also be considered as the alternative tautomeric form IIIA:



(IIIA)

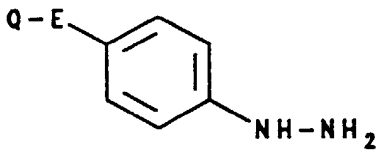
wherein R^d is as defined above.

A 3-substituted-1,2,4-oxadiazol-5-yl compound is produced if R^c represents a group -E-F and R^d in formula III represents a group A; whereas a 5-substituted-1,2,4-oxadiazol-3-yl compound is produced by the process of this invention when R^c represents a group A and R^d represents a group -E-F. A preferred reactive derivative of the acid R^c-

CO_2H in this case is a C_{1-4} alkyl ester. The reaction is conveniently carried out in the presence of a strong base, e.g. sodium hydride, using a suitable solvent, for example tetrahydrofuran, dimethylformamide or a lower alkanol such as ethanol, propanol or isopropanol, at about 20°C to 100°C for about 1 to 6 hours.

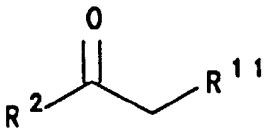
When the compound of formula IV is employed, the product of the process of this invention is a 1,3,4-oxadiazole. In this case, a preferred reactive derivative of the acid R^c-CO_2H is an orthoester of formula $R^cC(OR^p)_3$ where R^p represents C_{1-3} alkyl. The process is conveniently effected by heating the hydrazide IV with the orthoester in a solvent such as methanol at reflux temperature for about 2 to 8 hours. An intermediate of formula $R^d.CO.NH.N{=}C(R^c)OR^p$ may be isolated by evaporation of the solvent. The intermediate is then treated with a strong base such as potassium t-butoxide or 1,8-diazabicyclo[5.4.0]undec-7-ene, in butanol for about 10 to 24 hours at about 90°C to 150°C.

The reactive derivative of a carboxylic acid of formula R^c-CO_2H or the compound of formula III or IV, wherein R^c or R^d represents a group of formula -E-F, may be prepared by reacting a compound of formula VI:



(VI)

wherein Q represents a reactive carboxylate moiety, or a group of formula -C(NON)NH_2 or -$CONHNH_2$ or a protected derivative thereof or precursor thereto; and E is as defined above; with a compound of formula VII or a carbonyl-protected form thereof:



(VII)

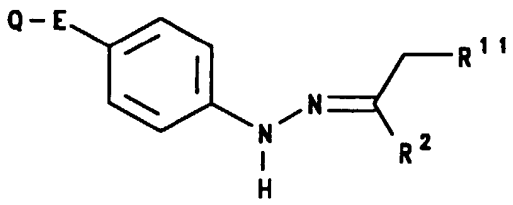
wherein R^2 is as defined above and R^{11} corresponds to the group R^1 as defined above or represents a group of formula -CH_2.CHR^4D, in which R^4 is hydrogen and D represents a readily displaceable group; followed, where required, by N-alkylation by standard methods to introduce the moiety R^3.

When the moiety Q in the compounds of formula VI represents a precursor to a group of formula -C(NOH)NH_2 or -$CONHNH_2$, this group is suitably a nitrile group.

Suitable carbonyl-protected forms of the compounds of formula VII include the dimethyl acetal or ketal derivatives.

The readily displaceable group D in the compounds of formula VII suitably represents a halogen group, preferably chlorine. When the moiety R^{11} in the compounds of formula VII is a group of formula -CH_2.CHR^4D, the substituent D is displaced in situ under the prevailing reaction conditions to afford a final product of formula I wherein R^1 represents a group of formula -CH_2.CHR^4.NH_2. The terminal amino group can subsequently, if desired, be further elaborated using techniques known from the art to give a compound of formula I wherein R^1 represents N-methylaminoethyl or N,N-dimethylaminoethyl.

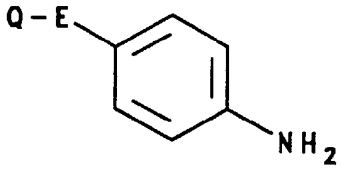
The reaction of compounds VI and VII may be carried out in a single step (Fischer indole synthesis) or by an initial non-cyclising step at a lower temperature to give a compound of formula VIII:



(VIII)

wherein Q, E, R^2 and R^{11} are as defined above; followed by cyclisation using a suitable reagent, such as a polyphosphate ester, to give a compound of formula Q-E-F.

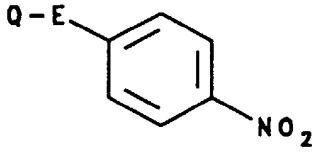
The hydrazines of formula VI may be prepared from the corresponding anilines of formula IX:



(IX)

wherein Q and E are as defined above; by diazotisation followed by reduction. Diazotisation is typically carried out using sodium nitrite/conc. HCl and the resulting diazo product reduced in situ using, for example, tin(II) chloride/conc. HCl.

The anilines of formula IX may be prepared by reduction of the corresponding nitro compounds of formula X:

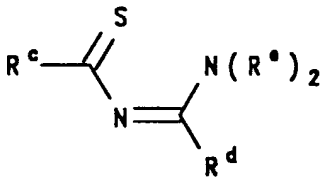


(X)

wherein Q and E are as defined above; typically by catalytic hydrogenation or using tin(II) chloride.

Where they are not commercially available, the nitro compounds of formula X may be synthesized by standard methods well known to those skilled in the art.

The 1,2,4-thiadiazoles of formula I may be prepared by a process which comprises the cyclisation of a compound of formula XI:



(XI)

wherein R^c and R^d are as defined above, and R^e is hydrogen or an alkyl group.

Cyclisation of compound XI can be achieved using an aminating agent such as hydroxylamine-O-sulphonic acid in a lower alkanol such as methanol, ethanol or propanol, in the presence of pyridine, at between -20°C and 50°C for about 1-6 hours.

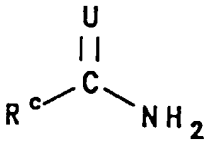
Cyclisation of compounds of formula XI in which R^e is hydrogen may also be achieved by use of an oxidising agent such as bromine, iodine, hydrogen peroxide or nitric acid.

The compounds of formula XI above may be prepared by the processes described in Comprehensive Heterocyclic Chemistry, ed. A.R. Katritzky and C.W. Rees, Pergamon Press, 1984, Vol. 6, p. 496, or by methods analogous thereto.

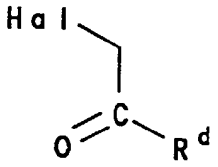
The 1,2,4-thiadiazoles may also be prepared by cycloaddition of a nitrile sulphide R^c-C≡N^+-S^- with a nitrile of formula R^d-CN where R^c and R^d are as defined above.

1,3,4-Thiadiazoles of this invention may be prepared by dehydration of a thiosemicarbazide of formula R^cCSNH-NHCONR^{s}R^t, where R^c is as defined above and R^s and R^t are hydrogen or an alkyl group, with a dehydrating agent such as sulphuric acid, polyphosphoric acid or methanesulphonic acid; followed by attachment of the R^d group by conventional means.

The oxazoles and thiazoles of this invention may be prepared by reaction of an amide or thioamide of formula XII with a α-haloketone of formula XIII:



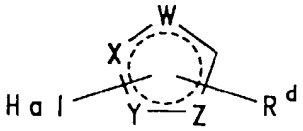
(XII)



(XIII)

wherein U is oxygen or sulphur, Hal represents halogen, and R^c and R^d are as defined above. The conditions for this reaction are as described in Synthesis, 1975, 389.

In an alternative process, the compounds according to the invention may be prepared by a method which comprises reacting a compound of formula XV:



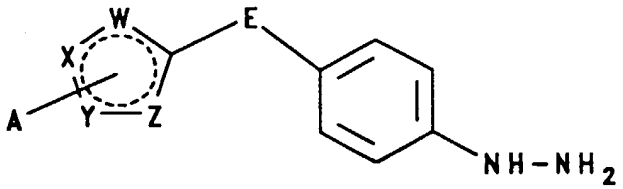
(XV)

with a reagent which provides an anion $^-R^c$, where W, X, Y, Z, R^c and R^d are as previously defined and Hal represents halogen.

Compound XV may be prepared by conventional procedures known from the art. For example, if compound XV is a 1,2,4-thiadiazole, this compound may be prepared by the general method described in Chem. Ber., 1957, 90, 182.

Reagents which may provide the anion $^-R^c$ include Grignard reagents R^cMgHal (where Hal = halogen); organocuprate reagents such as LiR^c_2Cu; organolithium reagents R^cLi; or compounds which stabilise the anion by means of an adjacent activating group such as an ester or enolisable ketone function. In this case, the adjacent ester or ketone function may be retained after the process is complete, or may be removed. For example, an ester moiety may be hydrolysed and decarboxylated.

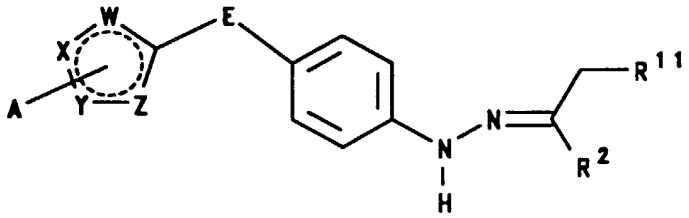
In a further process, the compounds according to the invention may be prepared by a method which comprises reacting a compound of formula XVI:



(XVI)

wherein W, X, Y, Z, A and E are as defined above; with a compound of formula VII as defined above, or a carbonyl-protected form thereof, e.g. the dimethyl acetal or ketal; followed, where required, by N-alkylation by standard methods to introduce the moiety R^3.

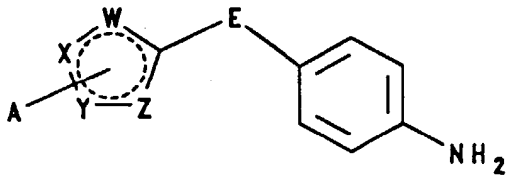
As with that between compounds VI and VII, the reaction between compounds XVI and VII may be carried out in a single step (Fischer indole synthesis) or by an initial non-cyclising step at a lower temperature to give a compound of formula XVII:



(XVII)

wherein W, X, Y, Z, A, E, R^2 and R^{11} are as defined above; followed by cyclisation using a suitable reagent, e.g. a polyphosphate ester.

The hydrazines of formula XVI may be prepared from the corresponding anilines of formula XVIII:



(XVIII)

wherein W, X, Y, Z, A and E are as defined above; by methods analogous to those described above with reference to the compounds of formula IX.

The anilines of formula XVIII may be prepared from those of formula IX above by appropriate modification of the moiety Q using, for example, methods analogous to those described above with reference to the compounds of formulae III and IV. Thus, for example, when Q in the compounds of formula IX represents a group of formula $-C(NOH)NH_2$ or $-CONHNH_2$, the compounds of formula XVIII may be prepared therefrom by reaction with a reactive derivative of a carboxylic acid of formula $A-CO_2H$, where A is as defined previously. Alternatively, when Q in the compounds of formula IX represents a reactive carboxylate moiety, the compounds of formula XVIII may be prepared therefrom by reaction with a compound of formula $A-C(NOH)NH_2$ or $A-CONHNH_2$.

It will be appreciated that any compound of formula I initially obtained from any of the above processes may, where appropriate, subsequently be elaborated into a further compound of formula I by techniques known from the art. In particular, a compound of formula I wherein R^3 is hydrogen initially obtained may be converted into a compound of formula I wherein R^3 represents C_{1-6} alkyl by standard alkylation techniques, for example by treatment with an alkyl iodide, e.g. methyl iodide, typically under basic conditions, e.g. sodium hydride in dimethylformamide. Similarly, a

compound of formula I wherein R^1 represents aminoethyl initially obtained may be converted into a compound of formula I wherein R^1 represents N-methylaminoethyl or N,N-dimethylaminoethyl by conventional N-alkylation techniques, e.g. by treatment with the appropriate aldehyde in the presence of a reducing agent such as sodium cyanoborohydride.

Where the above-described processes for the preparation of the compounds according to the invention give rise to mixtures of stereoisomers, these isomers may be separated by conventional techniques such as preparative chromatography.

The novel compounds may be prepared in racemic form, or individual enantiomers may be prepared either by enantiospecific synthesis or by resolution. The novel compounds may, for example, be resolved into their component enantiomers by standard techniques, such as the formation of diastereomeric pairs by salt formation with an optically active acid, such as (-)-di-p-toluoyl-d-tartaric acid and/or (+)-di-p-toluoyl-1-tartaric acid followed by fractional crystallization and regeneration of the free base. The novel compounds may also be resolved by formation of diastereomeric esters or amides, followed by chromatographic separation and removal of the chiral auxiliary.

During any of the above synthetic sequences it may be necessary and/or desirable to protect sensitive or reactive groups on any of the molecules concerned. This may be achieved by means of conventional protecting groups, such as those described in Protective Groups in Organic Chemistry, ed. J.F.W. McOmie, Plenum Press, 1973; and T.W. Greene, Protective Groups in Organic Synthesis, John Wiley & Sons, 1981. The protecting groups may be removed at a convenient subsequent stage using methods known from the art.

The following Examples illustrate the preparation of compounds according to the invention.

The ability of test compounds to bind to 5-HT_1-like receptors was measured in membranes prepared from pig caudate using the procedure described in J. Neurosci., 1987, 7, 894. Binding was determined using 2 nM 5-hydroxytryptamine creatinine sulphate, 5-[1,2-^{3}H(N)] as a radioligand. Cyanopindolol (100 nM) and mesulergine (100 nM) were included in the assay to block out 5-HT_{1A} and 5-HT_{1C} binding sites respectively. The concentration of the compounds of the accompanying Examples required to displace 50% of the specific binding (IC_{50}) is below 1 μM in each case.

The activity of test compounds as agonists of the 5-HT_1-like receptor was measured in terms of their ability to mediate contraction of the saphenous vein of New Zealand White rabbits, using the procedure described in Arch. Pharm., 1990, 342, 111. Agonist potencies were calculated as $-\log_{10}EC_{50}$ (pEC_{50}) values, from plots of percentage 5-HT (1 μm) response against the concentration of the agonist. The compounds of accompanying Examples 1, 4, 6, 19-21, 27, 28, 30, 39-42, 44, 45, 49, 52, 53, 56, 61, 65, 88, 93 and 110 were tested and were found to possess pEC_{50} values in this assay of not less than 5.0 in each case.

Step 1: 2-[5-(5-(3-Ethoxycarbonyl)-1,2,4-oxadiazol)ylmethyl)-1H-indol-3-yl]-N-(tert-butyloxycarbonyl)ethylamine

To a solution of 2-[5-Carboxymethyl-1H-indol-3-yl]-N-(tert-butyloxycarbonyl)ethylamine (3g, 9.4mmol) over 4A molecular sieves (3g), in tetrahydrofuran (100ml) was added triethylamine (2.62ml, 18.8mmol). The solution was stirred under nitrogen at room temperature for 1 hour and then cooled to -10°C. Isobutylchloroformate (2.45ml, 18.8mmol) was added and after stirring at -10°C for 15 minutes, a solution of (ethoxycarbonyl) formamide oxime (1.87g, 14.2mmol) in tetrahydrofuran (10ml) was added. The reaction mixture was allowed to warm to room temperature and stirred for 2.5hours. The suspension was filtered through Hyflo and the filtrate evaporated in vacuo to give a yellow solid. This was dissolved in 1,4-dioxane (25ml) and heated to reflux over 4A molecular sieves (3g) under nitrogen for 2 days. After filtering through Hyflo, the filtrate was evaporated in vacuo and chromatographed on silica (gradient elution 3:1 petroleum ether:ethyl acetate then 1:1 petroleum ether: ethyl acetate) to give the desired ester oxadiazole as a yellow gum (1.56g, 40%). δ (360MHz, $CDCl_3$) 1.42 (3H, t, J = 7.1Hz), 1.43 (9H, s), 2.92 (2H, t, J = 6.8Hz), 3.44 (2H, m), 4.40 (2H, s), 4.48 (2H, q, J = 7.1Hz), 7.04 (1H, s), 7.15 (1H, dd, J = 1.6, 8.3Hz), 7.32 (1H, d, J = 8.3Hz), 7.54 (1H, s), 8.13 (1H, s). m/z (EI), 414 (M^+), 358, 297, 212, 143, 115, 91.

Step 2: 2-[5-(5-(3-(Carboxamido)-1,2,4-oxadiazol)ylmethyl)-1H-indol-3-yl]ethylamine

A solution of the ester oxadiazole (0. 19g, 0.46mmol) in ethanol (30ml) was cooled to 0°C (ice/water bath) and then ammonia gas was bubbled through for 15 minutes. The solvent was evaporated in vacuo to give 2-[5-(5-(3-(Carboxamido)-1,2,4-oxadiazol)ylmethyl)-1H-indol-3-yl]-N-(tert-butyloxycarbonyl)ethylamine as a yellow gum (0.17g). The crude residue was dissolved in dry dichloromethane (20ml) under nitrogen, cooled to 0°C and trifluoroacetic acid (1ml, 13.0mmol) was added. The solution was allowed to warm to room temperature and stirred under nitrogen for 3 hours. The solvent was evaporated in vacuo and the residue was azeotroped with toluene (2 x 5ml) to give a pale orange gum. This was chromatographed on silica (eluant 20:15:5:1, ether:ethanol:water:ammonia) to give the desired amide oxadiazole as a beige gum (95mg, 72%).
